Mainpac Value-Add products

Mainview

Mainview is a KPI based monitoring facility operating across the various Mainpac functional areas and presented in a highly visual format, introduced for logical altering and analytical purposes.

How does Mainview work?

Relevant key performance indicator (KPI) sets are developed for each of the functional areas, linked to the underlying Mainpac application data tables and presented in a combined graphical reporting "view" format with attached component drill-down facilities.

Project Linker

The interface between Mainpac and Microsoft Project

This interface allows users to export maintenance jobs from Mainpac into Microsoft Project where they can be scheduled to most effectively use available resources. MS Project has advanced capabilities for achieving the optimum use of resources.

Once scheduled, jobs are imported back into Mainpac for issuing and completion in the normal manner.

Graphics simplify the understanding of maintenance workload

A key feature of MS Project is the capability to see jobs and schedules represented with greater clarity through the use of GANTT charts.

Connect

Acknowledging the increasing requirements of our Industry for system "openness" and the need for "best of breed" applications to collaborate with each other; Mainpac has developed a number of interface or "bridging" facilities for operation between Mainpac and an organisation's in-place enterprise wide (ERP/MRP or FMS) systems.

Mainpac Connect provides an interface/porting facility for seamlessly joining the relevant ERP materials, operational and financial management functionality of in-place systems with the appropriate job and plant management functionality of Mainpac.
